

Sensor field review

An observed difference is a reason to inspect the data.

Three stations · twelve observations each
Calibration and sampling context remain unknown.

The summary retains counts and baseline context

Station	Observations	Baseline mean	Follow-up mean
A	12	18	16
B	12	17	24
C	12	18	19

Counts describe the sample. They do not establish comparable conditions.

Station B has the highest follow-up mean

24

arbitrary units
Station B follow-up
mean

Descriptive ordering; no
significance test.

The baseline comparison remains exploratory

Station	Baseline	Follow-up	Change
A	18	16	-2
B	17	24	+7
C	18	19	+1

Change = follow-up minus baseline, in arbitrary units.

Variation and sampling context are needed before interpreting the difference.

Supported observations and missing evidence

Supported by the summaries

The recorded counts are equal.

Station B has the highest follow-up mean.

The baseline differences can be checked.

Still unknown

Calibration and measurement conditions.

Individual variation and pairing.

Reasons for the observed difference.

Verify measurements before interpreting differences

1 Check calibration

Recover instrument records and assess comparability.

2 Recover source observations

Inspect timestamps, pairing and variation.

3 Review sampling conditions

Assess alternative explanations before inference.
